ANALYZING MCCRES DATA

by
Zeev Barzily

The Marine Corps Combat Readiness Evaluation System (MCCRES) is designed to evaluate the state of readiness of Marine units. The present report describes MCCRES and suggests a method for analyzing the data obtained. The analysis determines the weaknesses and strengths of units, helps plan future evaluations, and serves as a tool for planning of training programs.

ANALYZING MCCRES DATA

by

Zeev Barzily

I. Introduction

The Marine Corps Combat Readiness Evaluation System (MCCRES) evaluates the performance of Marine units in simulated combat. Specific tests have been designed to evaluate infantry units, rotary wing and observation squadrons, combat support elements, and combat service support units. The present report deals with evaluating the performance of infantry battalions as described in Volume II of MCCRES.

A major difficulty in measuring the readiness of a military unit results from the fact that the unit is not evaluated under real combat conditions. It is evaluated instead while executing several exercises representing typical operations the unit is supposed to be able to execute. To avoid this difficulty it is common to replace the question "Can the unit do the job?" by "How 'close' is the execution to the doctrine." It is assumed that units which follow the doctrine closely are likely to be able to do the job.

Methods for assessing the readiness of military units are discussed in our survey [1]. In that report we conclude that the most promising

approach, in our opinion, is the data analysis approach. The present paper applies this approach. In Section II we describe how the data are collected and in Sections III and IV we propose a method for analyzing data that come from MCCRES evaluations. The analysis aims at helping to determine measures to improve the performance of battalions in MCCRES and to determine efficient evaluation procedures.

II. Description of the Test for Infantry Units

Volume II of MCCRES consists of five sections. Each section consists of Mission Performance Standards (MPS). The MPS in turn consist of tasks and each task consists of requirements, which are the most elementary part of MCCRES. The composition of Volume II of MCCRES is given in Figures 1, 2, 3, and 4. The only missing section in the figures is the fifth, Section 2X - Standard Performance Tests. This section is not discussed in the present report. We do not list the requirements in Figures 1-4, because they number 793. But the requirements are classified according to the ten categories of Section III and in the four figures we present the breakdown of the requirements into these ten categories.

The requirements pose questions that, when applicable, can be answered either by YES or by NO. A unit scores a "YES" if all conditions of the requirement are satisfied, otherwise, it scores a NO. As an example we list here the requirements that constitute the task 2B.1.1 - Debarkation for MPS 29B.1 - Surface assault.

- 2B.1.1.1 - Unit prepares for debarkation:
muster personnel, inspects arms and
equipment, and issues ammunition
- 2B.1.1.2 - Final debarkation schedules established (KI)
- 2B.1.1.3 - Debarkation teams report to debark stations
when called away (KI)
- 2B.1.1.4 - Vehicle drivers man vehicles when called away (KI)
- 2B.1.1.5 - Individual marines board assault amphibians and
landing craft in an expeditious manner (KI)

of EMCON
- 2B.1.1.8 - Unit reports crossing of LOD to high HQ.

In many cases there are Key Indicators (KI) for the evaluators which list specific items and precise details necessary for a score of YES; these introduce considerable objectivity and uniformity.

Throughout this report we refer to the sections, missions, tasks, and requirements as elements belonging to level 1, level 2, level 3 and level 4, respectively. As explained earlier, each element in level i ($i = 1, 2, 3$) consists of several elements in the $(i+1)$ st level. The elements in the $(i+1)$ st level will be designated as the partition of the element. The relative importance of the elements of a partition is reflected by the weights assigned to them. For example, the four tasks of MPS 2B.1 - Surface assault, see Figure 2.1, have the weights 40, 100, 100, and 70, respectively.

The evaluation process starts with the determination of the applicable elements. This determination is necessary since evaluating all MCCRES elements in a single exercise would require such a long period of time and so many resources as to be impractical. If the applicable elements are carefully selected, then an accurate picture of the state of readiness of a unit can be obtained even though some elements are omitted. After deciding on the applicable elements then, the weights of those elements are normalized. For example, if 2B.1.1, 2B.1.2, and 2B.1.3 are applicable and 2B.1.4 is not, then using the nonnormalized weights given earlier yield the following respective normalized weights

$$\frac{40}{240} , \quad \frac{100}{240} , \quad \frac{100}{240}$$

Finally, we obtain an absolute weight for each applicable requirement of an evaluation by multiplying its normalized weight by the normalized weights of its task, MPS, and section. By following this procedure the sum of the requirement's absolute weights equals unity. The evaluation score is defined to equal the sum of the absolute weights in which the unit obtained a "YES."

As indicated earlier, the first phase of an evaluation is the determination of the applicable parts. Some parts must be applied whenever an evaluation is conducted while others are optional and are to be selected by the units command. In Figures 1-4 we indicate the optional and compulsory parts of MCCRES. (The next section includes a discussion of the determination of an evaluation's applicable parts.) Deciding not to apply a part means that all related parts in lower levels become Not Applicable (N/A). Sections C and D, for example, are optional. Thus, if Section C is chosen to be N/A in an evaluation then all of the Mission Performance Standards, Tasks, and Requirements related to C become N/A. If, on the other hand, it is decided to apply Section C, then C2 is compulsory but C1, C3, and C4 are optional. Examining Figures 1-4 we find that the compulsory parts of Volume II constitute about 50 percent of the total number of requirements.

The second phase of an evaluation is the evaluators' briefing. The evaluators are usually officers whose battalions are to be evaluated in the near future and this experience with MCCRES helps them to prepare for their evaluation. In the briefing the evaluators are assigned to the unit's components and are informed about the applicable parts of MCCRES. They are also instructed how to observe the details of the battalion's performance and how to decide on the YESs and NOs.

The next phase is the simulated combat. While the unit is executing, the evaluators take notes and decide on the scores. The evaluators' task is very tedious since they have to pay attention to numerous aspects of the execution and have to make many quick judgments.

When the simulated combat is over, the evaluators gather and under the supervision of the senior evaluator they decide on a common score for each requirement. This score reflects the overall performance of the battalion. The common scores then yield the evaluation's score.

III. A Categorization of MCCRES Requirements

The YESs and the NOs of an evaluation contain considerable information concerning the weaknesses and the strengths of the battalion. The difficulty in analyzing the data is due to the high dimensionality - several hundred requirements. To overcome this difficulty we initiated classifying all the requirements according to a set of mutually exclusive and exhaustive categories. A preliminary set of nine categories was suggested by us and a tenth category was added through an audit by instructors at the Infantry Officers Course, Basic School. The ten categories, where the numbering has no special significance, are as follows.

1. REPORTING to higher levels of command
2. PREPARING for operations
3. COMMUNICATING (including Communications SOPs)
4. PERFORMING as Marines (discipline, dispersion, camouflage concealment, using weapons, and so on)
5. DELIVERING supporting fire
6. PLANNING of operations
7. CONFORMING to doctrine
8. EXECUTING operations
9. PROVIDING combat service support (including medical support)
10. SUPERVISING required actions of individual Marines.

Each category corresponds to a vital aspect of the unit's performance

during the evaluation and each requirement is to be assigned to the single category judged to most closely fit the most essential feature of the requirement. The above categories are chosen so that they not only make it possible to classify the requirements but so that they correspond to special areas for training and remedial actions which can be used to improve combat readiness.

We now explain in some detail the meaning of the ten categories. In general, commands of units are mainly evaluated by the following categories: 6(Planning), 2(Preparing), 8(Executing), 1(Reporting), 7(Conforming), and 10(Supervising). The performance of individual Marines is evaluated by 4(Performing) and the performance of some special groups is evaluated by: 3(Communicating), 5(Delivering), and 9(Providing).

Performance of the Command

Let us consider the six categories that mainly evaluate command. The first is 6(Planning of operations). This category deals with the question: How well are the operations planned? Examples are

- 2A.1.5.4 - Patrols not dispatched on repetitive or stereotyped routes
- 2B.4.8.5 - Reserve is positioned to assist forward elements in containing any penetration
- 2B.6.1.3 - Staff coordination IAW FMFM 3-1; emphasis: organization of the ground, integration of fire planning, security operations, and intelligence collection
- 2B.6.2.2 - Machine guns are positioned to deliver flanking interlocking grazing fire from mutually supporting positions.

The next is 2(Preparing for operations). Preparations start after some phases of planning have been completed. Preparations include issuing orders, rehearsals, and accomplishing some other preliminaries. Examples are

- 2A.1.5.5 - Marines assigned to security actions thoroughly briefed and inspected

- 2A.1.6.2 - Unit to patrol is alerted a minimum of four hours prior to patrols
- 2B.2.2.1 - Individual Marines and their equipment inspected
- 2C.3.2.4 - Small unit leaders in assault elements conduct rehearsal of specialized techniques required (LI).

Next is 8(Executing operations). These requirements measure the leadership of the unit's command and the teamwork. Examples are

- 2A.2.1.2 - Unit exercises control over maneuver of subordinate elements (KI)
- 2B.1.1.3 - Debarkation teams report to debark stations when called away (KI)
- 2B.4.3.6 - Assault elements move into attack positions
- 2B.2.3.3 - Speed and momentum of movement maintained
- 2C.3.6.10- Attacking enemy forces halted and ejected from built up areas.

Next is 1(Reporting to higher levels of command). Included here are acknowledgments of receiving orders, reports on progress of operations, and reports on information obtained about the enemy. Examples are

- 2B.4.4.7 - Bypassed enemy units reported by assault elements
- 2B.4.8.1 - Security elements report enemy counter-attack preparations
- 2B.4.8.4 - Unit reports counterattack to higher HQ
- 2B.1.5.6 - Seizure of objective reported to higher HQ

Next is 7(Conforming to doctrine). Examines the technical knowledge of the command. These requirements are normally easy to satisfy provided

the command does not forget (or overlook) them. Examples are

- 2A.1.9.2 - Unit has an alarm system for gas or other chemical attack
- 2A.2.1.1 - Unit has and uses an operation SOP
- 2B.5.3.1 - Security element provides guides to lead assault elements to LOD
- 2C.4.2.2 - Marines who make the initial contact immediately begin screening evacuees into categories (KI).

Last is 10(Supervising required actions of individual Marines). Requirements here are satisfied through observation and appropriate direction. These are usually provided at company commander or lower levels. Examples are

- 2A.1.1.2 - Weapons maintenance discipline
- 2A.1.3.2 - Halted elements do not remain in exposed locales, moving immediately into nearest cover.

Performance of Individual Marines

Here the requirements concern how well the Marines, as individuals, are prepared to execute their jobs. All are classified under 4(Performing as Marines). Principal concerns are discipline, dispersion, camouflage, concealment, using weapons, and so on. Examples are

- 2A.1.10.4 - When attacked, Marines, including officers and NCOs, react by taking cover
- 2A.2.10.5 - Unit keeps stockpiles of material and ammunition dispersed
- 2B.2.4.1 - On landing, Marines deplane quickly and safely and disperse as helicopters lift out of zone
- 2B.4.5.2 - Assault elements deliver heavy volume of fire as they close on objective.

The Performance of Some Special Groups

Three categories fall under this heading. The first is 3(Communicating). These requirements deal with the performance of the teams in charge of the operation of the radio and wire communications. The question is: can the units properly transmit the required information? Also included are communications SOPs. Examples are

- 2A.1.8.1 - All radio nets specified as covered circuits in the communications plan operate in the covered modes
- 2A.2.2.3 - Unit enters tactical and command nets of higher HQ
- 2A.2.7.4 - LZ communications provide positive control of inbound and outbound helicopters (KI)
- 2A.3.2.1 - FSCC communications are functioning (KI)

The next is 5(Delivering supporting fire). This category evaluates the entire performance of the supporting fire units. Examples are

- 2A.3.2.3 - Routine calls for fire are monitored, recorded, and plotted
- 2A.3.6.1 - Counterfire priorities are included in fire support planning
- 2B.1.3.3 - As soon as direct support artillery is emplaced, FO's with lead elements direct fire against appropriate targets
- 2B-4.8.3 - All available fire support employed against counterattack.

Last is 9(Providing combat service support). The performance of the logistics and medical groups is evaluated here. Examples are

- 2B.1.4.4 - Emergency resupply capability retained as material is staged ashore (KI)

2B.4.2.6 - Vehicles checked for fuel state and refueled.

2B.6.6.9 - Immediate action taken to reconstitute supply and ammunition levels prescribed for the position in the defense order

2C.3.2.3 - Specialized equipment issued (K1).

The following table gives some indication of the relative importance of the ten categories. (See Figures 1-4 for more details.)

Table 1: The relative importance of the ten categories.

Categories	Number of Requirements	Percentage of number of requirements under this Category	Weight of Category
1. REPORTING	105	13	5
2. PREPARING	81	10	7
3. COMMUNICATING	48	6	7

9. PROVIDING	41	5	5
10. SUPERVISING	19	3	6
TOTAL	793	100	100

From general considerations it would be desirable to avoid using categories in which very few requirements appear (because this would tend to indicate that such categories were relatively unimportant) or in which too many

appear (because this would indicate that there might be duplication of concepts or that potential information was being lost through excessive aggregation).

A computer program has been written to do the following.

- (1) Calculate evaluations scores
- (2) Repeat the above calculations under the change that all requirements are given equal weights
- (3) Compute categories scores. (Total weights of YESs divided by total weights of applicable requirements.)

The computer program was run with data of 13 evaluations. The Not Applicable (N/A) parts of these evaluations are given in Table 2 and the results of the computer runs are shown in Table 3. The mean score of category, the right-hand-side column of Table 3 is simply the mean of the scores of the category in the 13 evaluations. The unweighted scores are the scores obtained when it is assumed that all applicable requirements have the same weights.

Examining the results of Table 3 we realize that Category 4(Performing as Marines) scores 70 on the average, which is lower than the others. It is also interesting to note that Category 5 scores 93 on the average, which is better than the others. Each of the units has its weaknesses and strengths. Unit Number 1, for example, was weak in Categories 4 (60.0%), 8 (69.8%), 9 (69.1%), and 10 (67.6%). But this unit performed very well in Categories 3 (100%), and 6 (93%). The results shown in Table 3 indicate that all units have their strengths and weaknesses, and thus calculating these scores can help in planning of remedial training.

Table 2: List of N/A Sections, MPSs, and Tasks in 13 Evaluations.

Set No.	Number of Applicable Requirements	List of N/A Parts

IV. Using MCCRES Data for Planning the Training and Testing Programs

The key assumption in this section is that requirements belonging to the same category pose similar demands on the unit's components and, thus, have the same probability of scoring a YES. This assumption is related to but not implied by the definition of the categorization. We examine the feasibility of this assumption in two ways. First we compare MPS category scores to evaluations categories scores in several evaluations. The results are given in Table 4. (The numbers in parentheses in the table are the numbers of the MPS requirements belonging to the given category.) We then examine the effects of reducing the number of applicable requirements on the evaluations and categories scores. We use the 13 evaluations of Table 2 and for each evaluation we ran three cases in which some of the optional applicable parts were removed by assigning them as N/A. A description of the 39 cases and the results of the computer runs are given in the appendix. The results are summarized in Figures 5 and 6. In all cases examined, we observed that the categories scores came close to the original categories scores. This observation indicates that our assumption is reasonable.

The data in Table 4 and in Figures 5 and 6 strongly suggest that the number of applicable requirements can be substantially lower than 793 while the category scores still remain precise. This result is important because the evaluation of a battalion on all requirements would require substantial resources. Note that only about 50 percent of the requirements must be applied whenever an evaluation is conducted, while the others should be chosen according to the expected deployment of the unit and the available resources. The second result is related to the determination of a training program and is discussed in the remainder of this section.

Several factors such as the available budget, the length of the training period, and possible future deployment should be taken into

Table 4: Some MPS category scores compared to evaluation category scores.

Evaluation Number	Scores of	Category Number									
		1	2	3	4	5	6	7	8	9	10
1	MPS 2.A.1	82	44	100	58	-	100	72	31	67	80

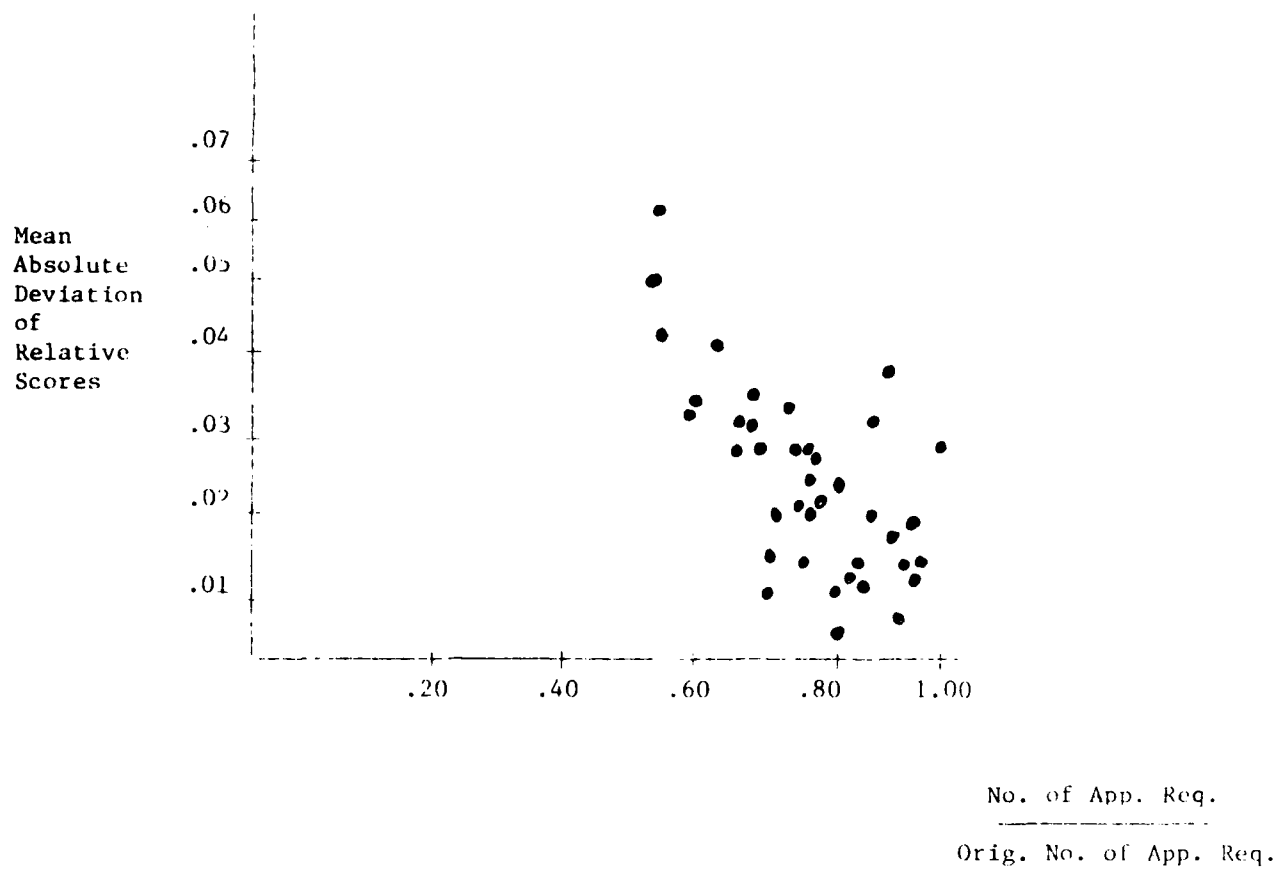

Figure 6: Mean absolute deviations of categories scores in the 39 cases.

account when a training program of a Marine Unit is determined. For example, it may be desired to train a unit under severe budget constraints for a helicopterborne assault. Then it may be useful initially to train the unit to execute lower cost but related MPSs and only later to begin execution of the more expensive helicopterborne assaults. Another example might be that one wants to train a unit for the execution of a night attack. There the question could be: how can some daytime MPSs be selected that can also serve to train the unit for night attacks? We are interested therefore in a method for measuring "distance" between MPSs. Namely, two MPSs are considered to be "close" if they require similar efforts from a unit's components so that training for either one will also improve the performance of the other.

To be able to measure distance between MPSs we define the composition of an MPS as the distribution of the number of its requirements among the ten categories. (We prefer to calculate the distribution of the number or requirements rather than the distribution of their weights because of mathematical convenience, but the results do not change much if the second alternative is taken.) Table 5 presents the composition of the MPSs. We explain the entries of the table by explaining those of the first row. The number 90 in the final column indicates that MPS 2.A.1 contains 90 requirements: twelve percent of them belong to category 1 (11 requirements), ten percent belong to category 2 (9 requirements), and so on. We see that MPS 2.A.1 contains the smallest (17). Some MPSs contain requirements belonging to many categories, 2.D.3 for example. Now, define the distance between the composition of two MPSs as the sum of absolute deviations between their composition entries. For example, referring to the data in Table 5, we calculate the distance between the composition of 2.A.1 and 2.A.2 as the sum of absolute values

$$\begin{aligned}
 &|12-10|+|10-0|+|5-23|+|21-1|+|0-9|+|3-11|+|20-21|+|15-10|+|3-11|+|11-4| \\
 &=2+10+18+20+9+8+1+5+8+7 \\
 &=86.
 \end{aligned}$$

Table 5: Composition of the MPS.

MPS	Cat. 1	Cat. 2	Cat. 3	Cat. 4	Cat. 5	Cat. 6	Cat. 7	Cat. 8	Cat. 9	Cat. 10	No. of Requirements
2.A.1	12	10	5	21	0	3	20	15	3	11	90
2.A.2	10	0	23	1	9	11	21	10	11	4	88
2.A.3	0	0	3	0	86	9	2	0	0	0	56
2.B.1	22	0	0	3	6	16	9.5	28	9.5	6	32
2.B.2	15	13	2	4 1/4	4 1/4	20	7	26	4 1/4	4 1/4	46
2.B.3	23	15	8	0	2.5	8	2.5	41	0	0	39
2.B.4	18	9	2	0	3	21	16	26	3	2	66
2.B.5	12	14	6	6	0	26	16	18	2	0	50
2.B.6	15	10	4	6	4	29	15	13	4	0	52
2.B.7	24	4	0	0	2	34	0	30	6	0	47
2.C.1	18	8	3	0	3	20	0	43	0	5	39
2.C.2	13	27	5	0	5	23	9	18	0	0	22
2.C.3	16	12	5	0	7	25	2	28	5	0	43
2.C.4	25	19	0	0	0	31	25	0	0	0	16
2.D.1	3	6	10	0	13	62	0	0	6	0	63
2.D.2	7	26	4	0	0	7	11	11	34	0	27
2.D.3	0	71	6	0	0	23	0	0	0	0	17

This form of distance is often used and it has useful mathematical properties. The distance between two MPSSs varies from 0, where they have the same composition, to 200 (where they do not have any categories in common). The choice of this distance function is logical if all categories are equally important and if any two deviations of x percent are as meaningful as one deviation of $2x$ percent. Table 6 presents the distance between each pair of the 17 MPSSs of Volume II of MCCRES. The numbers in the parentheses are the distances between the MPSSs. We realize that some MPSSs have many close MPSSs, 2.B.1, 2.B.2, for example, while others like 2.A.3 and 2.D.3 do not.

V. Summary

In the present report we have described MCCRES and some analysis performed on MCCRES data. We feel that MCCRES has the following merits.

- (a) Most requirements are requests for descriptive data and not for judgments. Judgments were previously made by defining the requirements and assigning weights.
- (b) The details of the doctrine are given and interpreted in the requirements, thus avoiding the possibility of being misinterpreted or forgotten by the evaluators.
- (c) The execution of most requirements consume short time periods and thus the evaluator's memories are not overburdened.
- (d) Assigning a score of a YES or NO is easier than assigning scores on any other scale.
- (e) The set of requirements exhausts the details of the executions.

Table 6: The distances between the MPS in Volume II

The merits described above help the evaluators to assign objective scores.

The analysis of the evaluations data has three objectives. The first objective is to determine the weaknesses and strengths of the evaluated battalions. We reach this goal by calculating categories scores. These scores can help determine remedial actions; for example, to improve a poor performance in category 6 (Planning) it may be efficient to train the Marines involved in planning by assigning them several operations to plan. The second objective is the examination of the sensitivity of the scores to the number of applicable requirements. Here we observe that reducing the number of applicable requirements to about 60 percent yields scores which are fairly precise. The third objective is the determination of close MPSs. Here we define a measure of distance between MPSs. We believe that close MPSs, according to the proposed measures, require similar efforts from units' components and thus training for an MPS will improve the performance in all MPSs that are close. As we obtain more MCCRES evaluation data we will be able statistically to test our findings in objectives two and three.

THE GEORGE WASHINGTON UNIVERSITY

BENEATH THIS PLAQUE
IS BURIED

A VAULT FOR THE FUTURE
IN THE YEAR 2036

THE STORY OF ENGINEERING IN THIS YEAR OF THE PLACING OF THE VAULT AND
ENGINEERING HOPES FOR THE TOMORROWS AS WRITTEN IN THE RECORDS OF THE
FOLLOWING GOVERNMENTAL AND PROFESSIONAL ENGINEERING ORGANIZATIONS AND
INDIVIDUALS: GEORGE WASHINGTON UNIVERSITY

BOARD OF COMMISSIONERS, DISTRICT OF COLUMBIA
UNITED STATES ATOMIC ENERGY COMMISSION
DEPARTMENT OF THE ARMED SERVICES OF AMERICA
DEPARTMENT OF THE ARMY, UNITED STATES OF AMERICA
DEPARTMENT OF THE NAVY, UNITED STATES OF AMERICA
NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS
NATIONAL BUREAU OF STANDARDS, U.S. DEPARTMENT OF COMMERCE
AMERICAN SOCIETY OF CIVIL ENGINEERS
AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS
THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS
THE SOCIETY OF AMERICAN MILITARY ENGINEERS
AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS
DISTRICT OF COLUMBIA SOCIETY OF PROFESSIONAL ENGINEERS, INC.
THE INSTITUTE OF RADIO ENGINEERS, INC.
THE CHEMICAL ENGINEERS' CLUB OF WASHINGTON
FEDERAL SOCIETY OF ENGINEERS
FRANKLIN MORGENTHAU & STEPHENS - ARCHITECTS
CHARLES H. TOMPKINS COMPANY - BUILDERS
SOCIETY OF WOMEN ENGINEERS
NATIONAL ACADEMY OF SCIENCES, NATIONAL RESEARCH COUNCIL

THE PURPOSE OF THIS VAULT IS INSPIRED BY AND IS DEDICATED TO
CHARLES HOOK TOMPKINS, DOCTOR OF ENGINEERING
BECAUSE OF HIS ENGINEERING CONTRIBUTIONS TO THIS UNIVERSITY, TO HIS
COMMUNITY, TO HIS NATION, AND TO OTHER NATIONS.

BY THE GEORGE WASHINGTON UNIVERSITY

ROBERT A. FLEMING
CHAIRMAN OF THE BOARD OF TRUSTEES

CLOYD H. MARVIN
PRESIDENT

GEORGE WASHINGTON UNIVERSITY
WASHINGTON, D.C.

To cope with the expanding technology, our society must
be assured of a continuing supply of vigorously trained
and educated engineers. The School of Engineering and
Applied Sciences is completely committed to this
objective.
